

Auth

Instantly Authenticate The Identity of Users

Auth instantly authenticates the identity of users via bank account aggregation. By accessing a user's bank account, you can validate that they own that account and instantly obtain account and routing numbers for ACH transfers without having to do microdeposits which can take up to 2-3 business days.

At the API level, Auth works the following way (continued on next page):

```
from synapse_pay_rest.models.nodes import AchUsNode

# enter required body parameters to create ACH Node
body_params = {
    'bank_name': 'fake',
    'username': 'synapse_good',
    'password': 'test1234'
}

# make request to API for Node creation
ach_us = AchUsNode.create_via_bank_login(user, **body_params)
```
