

Special Systems

DISCOVER | PLAN | INTEGRATE

Enhance productivity and extend technological possibilities.

STRUCTURED CABLING:

Versatile, organized and powerful cabling systems that enhance productivity and support future business development.

SECURITY SURVEILLANCE:

Improve ability to keep people and property safe. IP and wireless camera networks are used to monitor rooms and device integration across entire facilities. To further assist challenges of monitoring larger facilities Immedia utilized newer web-based technologies such as facial recognition.

PROXIMITY ACCESS CONTROL:

Increase security and protect business employees or access to buildings. Access control systems can regulate all movement in and out of a facility and can be installed on single or multi-door systems, multi-building networks and include proximity and/or biometric readers to ensure accurate data is recorded and available at all times.

DISTRIBUTED ANTENNA SYSTEMS (DAS):

Improved cellular coverage increased efficiency & productivity. Through cellular amplification, DAS allows signals to reach areas not previously made possible, such as underground parking garages.

INTERCOM & PAGING:

Flexible & productivity-boosting communication systems are significantly beneficial in emergency situations that need an immediate announcement, while paging systems are widely popular in hospitals and educational facilities.

SOUND MASKING:

By adding ambient sound to a space it makes it appear quieter, increases productivity and through promoting collaboration and protects confidential conversations & reduces liability.

WIRELESS NETWORKING:

Convenient mobility and increased productivity by encouraging collaboration throughout the office through a wireless local-area network (LAN).
