

# Link references faster with Paige

Currently, the process of referencing medical claims is an expensive, frustrating, and time-consuming manual process. With Paige, we are streamlining the process to improve the speed and accuracy of references.

## Introducing Paige

Paige is our artificial intelligence engine that recognizes substantiated and well-referenced claims, understands the intent of a claim, and suggests relevant references based on user history. With minimal maintenance required, Paige analyzes your previously linked annotations to provide you with informed recommendations.

## Speed

The process of highlighting a medical claim and looking for its exact citation in another document is tedious and inefficient. You can now spend less time scrolling and more time linking annotations. Paige is proven to be 10x faster than the process of manually creating references.

## Accuracy

Paige uses a type of technology called **Natural Language Processing (NLP)**. In short, it understands the intent of the text in order to find matching citations even when the content is reworded. With enhanced measures of accuracy, we leave text-match solutions in the dust.

## Easy Setup

Reference recommendations work automatically based on previous user behavior. You can say goodbye to database maintenance and excel approval uploads. It just works.

## Best in class data privacy

Our AI processing engine collects user data from only your workspace and is protected by a security firewall.
