

MOOV Multi-Tenant

Simple management of shared
parking capacity

Satisfied tenants and simple management of shared parking capacity

These days, more and more office buildings are being shared by different companies. Besides the division of the building itself, other facilities, such as parking areas, are often also shared. Although such multi-tenant locations offer many advantages, frustration and arguments may arise if people do not stick to the agreements, for example, when employees and visitors from one company constantly park in spaces that are leased by another company. Moreover, managing access rights can become a major administrative challenge for you, the facility manager.

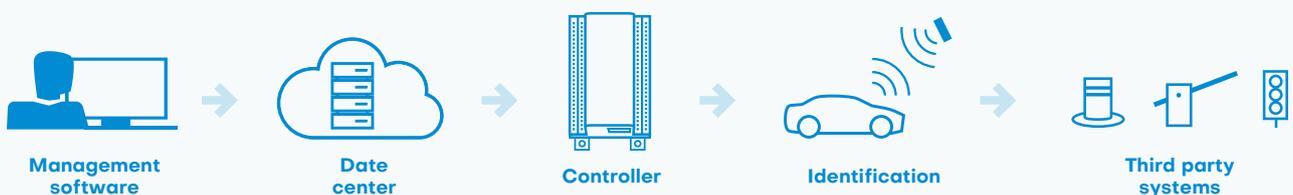

What if there was a system that automatically granted access to vehicles, based on the agreed capacity per tenant?

Discover MOOV Multi-Tenant

MOOV Multi-Tenant is an effective, user-friendly solution that helps facility managers to control selective access for vehicles to shared parking areas. The MOOV software allows very easy definition of parking capacity agreements per tenant, and the MOOV hardware controls the connected barriers. The platform has been specifically designed for use in multi-tenant environments, so all of the practical processes have been carefully considered.

How it works

Why managers of shared parking areas choose MOOV Multi-Tenant

An appropriate identification method for each type of vehicle

The MOOV solution is compatible with virtually any form of identification technology, and they can be combined at a common site. For example, you can choose between license plate recognition or an employee admission pass, a QR code for visitors and special 112 transponders for guaranteed access of emergency services.

Tenants can manage their own access rights

As an administrator, you will want to be in control of the distribution of the available capacity, but you may not want to keep track of the access rights for each tenant. That is why the MOOV software makes it easy for tenants to manage their own access rights, without having anything to do with the data or administrative functions of other tenants. This gives the tenants a certain degree of control and can save you, the administrator, a lot of valuable time.

Insight into the occupancy rate and manual control for the reception desk

The MOOV software offers a real-time overview of which parking spaces are occupied and which are still available per tenant. The tenant's central reception desk or the front office can also make use of the overview to manually grant remote access to vehicles that have not been registered in advance. This is a useful function for use in combination with an intercom system.

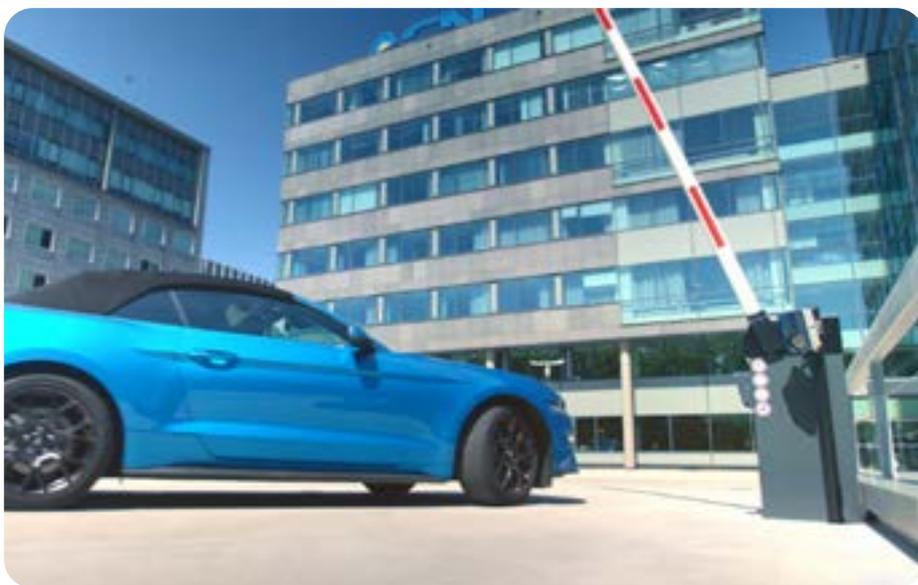

Integration of a display to indicate availability at the access point

A physical display at the boom, to indicate the number of available parking spaces per tenant, is a good way to show drivers why they may or may not enter the parking area.

The MOOV solution is compatible with virtually any form of identification technology, and they can be combined at a common site.

Simple, right? That's what people at over 300 other locations think.
