Heat has become the biggest bottleneck in computing. The latest processors promise higher performance, but only 50% or less is realized in actual devices. While processors continue to advance and generate more heat, thermal solutions have not kept pace. Thermal is the only aspect of modern day computing that still uses century old technology. In today’s devices, what often determines performance is the capability of the thermal solution, not the sophistication of the processor.

Frore Systems has developed a revolutionary active cooling chip, AirJet®, the first ever solid state thermal solution. AirJet® is a fully self contained active heat sink module. AirJet® is silent, thin, light and outperforms fans.

Inside AirJet® are tiny membranes that vibrate at ultrasonic frequency. These membranes generate a powerful flow of air that enters the AirJet® through inlet vents in the top. Inside AirJet® the air flow is transformed into high velocity pulsating jets.

The pulsating jets of air remove heat from the heat spreader at the bottom of the AirJet® with high efficiency. The flowing air reaches the same temperature as the heat spreader which is in contact with the processor. Hot air exits to the side via an integrated spout.

AirJet® Pro generates 1750 Pascals of back pressure, ensuring air flow into and out from product enclosures. When integrated into a compute platform with processor die temperature of 85°C, AirJet® Pro removes a net 8.75 Watts of heat at a silent 24 dBA noise level, while consuming 1.75 Watts of power.

AirJet®‘s multiphysics design converges structural, fluidic, acoustic and electrical resonance. AirJet® is manufactured using proprietary techniques that draw from multiple sectors, including semiconductor, flat panel display, aerospace and automotive.

AirJet® Pro generates 1750 Pascals of back pressure, ensuring air flow into and out from product enclosures. When integrated into a computer platform with processor die temperature of 85°C, AirJet® Pro removes a net 8.75 Watts of heat at a silent 24 dBA noise level, while consuming 1.75 Watts of power.

For example, 12 mm thick ultra-slim premium 15” notebooks use fans to increase the thermal limit to 18 Watts sustained processor power. The fans, however, generate 42 dBA of noise. In a similar 12 mm thick notebook, 3 x AirJet® Pro can support a sustained processor power of 28 Watts, at a silent 29 dBA noise level increasing processor performance by 1.5x.

In today’s devices, what often determines performance is the capability of the thermal solution, not the sophistication of the processor. Thanks to AirJet® Pro, premium ultra-slim notebooks can now deliver on the promise of cutting edge processor technology. Do more.
